Freshroots · Demand Planning and PO Automation — Components Map

Actor	Trigger	Input	Context	Processing	AI	Output
Planner (Buyer / Reviewer)	① Opens the link and clicks Run planning, or uploads fresh SAP exports (twice a week)	② Types a name, then decides each exception: Approve, Use suggested, Edit qty or Reject, plus a note				
System (React app + Python API on Vercel)			③ Loads the 5 SAP CSVs (sales, SKU master, distributors, inventory, calendar) and config.yaml thresholds	④ Cleans data, works out weeks of cover (festival ×1.25), forecasts 4 weeks, queues exceptions. No PO until all are decided		
Rules Engine (No ML, by design)					⑤ Written rules flag HIGH_DEMAND, STOCKOUT_RISK, OVERSTOCK and exceptions like BORDERLINE, with reasons. No ML; LLM hook off	
Integrations (Neon + Zoho + files)			⑥ Neon Postgres keeps runs, the append-only decision log and PO lines (without a DB the browser holds the run)			⑦ Builds PO PDFs, Zoho import CSV and handoff note; previews or creates DRAFT POs in Zoho Inventory
Sourcing Team (Raghav + buyers)						⑧ Gets urgent-first POs, releases the Zoho drafts; the run log tracks the override rate (above 30% = review the rules)
